Error FAQ

Java headspace or out-of-memory errors -
Java does not have enough memory to do what you requested. To alleviate this you can increase the maximum amount of memory java can use by going to "Fiji > Edit > Options > Memory & Threads…" (note: this must be done in independent Fiji rather than MATLAB - Fiji). Additionally, you can free up memory by cropping images or using virtual stacks on import.

Error using fgets. Invalid file identifier -
This occurs when the session restore function is given a folder that is not a session folder. Please ensure that when you select session restore a folder with the name scheme of '#_File' or' #_Batch' is selected.

"This command requires a TextWindow"
Restart MATLAB

ROI manager not coming up -
Restart MATLAB

Other issues?
When in doubt, restart MATLAB and insure another instance of Fiji is not running.

If none of that works
